Savi

Case Study

Transform and Improve Your Operations with True Visibility

PROBLEM

One of the world's leading biotechnology companies, with focus on developing therapies for multiple sclerosis, hemophilia, and other autoimmune disorders, needed true end-to-end supply chain visibility. This pharmaceutical company ships their therapies around the world, oftentimes, through high-risk areas in order to reach their patients.

With individual shipments worth 20-30 million dollars, supply chain performance and visibility is of utmost importance. Despite this, they did not know the current routes taken between origin and destination sites and, consequently, they were unaware of specific areas of risk or loss. As a result, this company needed better insight into the actual performance of their supply chain to optimize route performance and identify areas of risk for securing their goods from theft.

SOLUTION

Powered by
Hybrid Lambda Architecture

Using our SaaS solution, Savi Tracking, Savi was able to identify and monitor the location and status of their goods. We created origin and destination sites, corridors, and shipments using Savi Tracking to provide the customer true, realtime visibility. Savi generated alerts to improve performance and reduce risk regarding scenarios that were important to their mission, such as alerts for deviating from corridors and alerts for tampered tags at unauthorized locations. In order to reduce risk, Savi installed pallet tags for increased security, and we performed risk analysis using third-party data and weather information. Reports were designed to analyze routes they drove, where they stopped, stop duration, and risk events on particular routes.

BENEFITS

- Obtained insight into actual routes to optimize performance
- Gained better understanding of risk areas
- Alerted to real-time events that occured during shipments
- Identified trends to allow more proactive decisions and eliminate problems

INDUSTRY

Pharmaceutical

Savi Tracking is an SaaS solution that identifies and monitors the location and status of assets in motion. Specialized software and tamperproof hardware devices secure and monitor multiple cargo types to improve performance and reduce risk.
